

ABSTRACT OF THE DISCLOSURE

This invention is an attractive cover for trailer hitch components which mounts on the receiver tube. It is especially useful for those vehicles whose trailer hitch is visible through an opening in the bumper fascia of the vehicle. These exposed components are generally unattractive. On these vehicles this invention will complete and fill-in the bumper fascia opening with a material that complements the vehicles own bumper covering. This invention mounts on the receiver tube and encloses and protects the receiver tube, safety chain anchors, electrical connections and other trailer hitch components. This invention will help to protect trailer components from blows and rough handling, corrosion, being clogged with mud and dirt and UV damage due to sunlight. It will prevent harm to people from striking the hitch and will smooth the outline of a vehicle reducing the turbulence around the vehicle and making it more gas efficient.
